

Cybersecurity Incident Report:

Network Traffic Analysis

Part 1: Provide a summary of the problem found in the DNS and ICMP traffic log.

The UDP protocol reveals that: the affected protocol is DNS running over UDP

This is based on the results of the network analysis, which show that the ICMP echo reply returned the error message: udp port unreachable length 254

The port noted in the error message is used for: port 53

The most likely issue is: the device could not translate the website name into an IP address. There was no listening port for the website to deliver to.

Part 2: Explain your analysis of the data and provide at least one cause of the incident.

Time incident occurred: 1:24 p.m., 32.192571 seconds.

Explain how the IT team became aware of the incident: customer reports showed the website could not be reached with an error message.

Explain the actions taken by the IT department to investigate the incident: tcp dump was opened as to analyze the udp packets, reviewed the data response and analyze the errors, report findings, send to senior team member for evaluation.

Note key findings of the IT department's investigation (i.e., details related to the port affected, DNS server, etc.): the dns server is being affected here as it cannot translate the website name into an IP address.

Note a likely cause of the incident: dns server down, firewall blocking, incorrect IP configuration.
